Introduction

Since 1941, the State of Montana has used post-season surveys of hunting license and permit (LPT) holders to estimate wildlife harvest (Thompson 1947). Results of these surveys are used to develop hunting season regulations, evaluate and develop wildlife management strategies, for wildlife research, for hunt planning by the public, as well as other applications.

Over the years, methods used to conduct the surveys have gone through several changes. Some of these changes have resulted from major program reviews (Gooch 1971, Cada 1983, Cada et al. 1986), and some have resulted from the increasing complexity of hunting regulations (ex. Gooch 1971 vs. Martin 2005). Several program changes have also resulted from changes in staff responsible for conducting the harvest surveys.

License years 2004 and 2005 mark the beginning of a major change in staffing as well as a reorganization of the harvest survey team and program. For the previous 20+ years, the survey team has consisted of staff from the Research and Technical Services Bureau (RTS) in the Wildlife Division. This staff included the Bureau supervisor, a programmer/ analyst, and a survey coordinator to oversee a staff of approximately 60-80 survey interviewers that collected the data. The team has often had additional database programming support, and in recent years this support has come from non-agency contractors. Beginning in license year 2004, the RTS programmer/ analyst position was vacated and then eliminated. Duties related to data entry and data management, previously a responsibility of this position, have been transferred to the new Application Development Bureau in the Information Services Division. This permits increased focus on these activities and will lead to substantial program development in coming years. Subsequently, RTS created a biometrician position, which will have significant time devoted to the harvest surveys program. This position will focus on procedures for sampling LPT holders and estimating hunting and harvest-related quantities, which will add increased focus on these areas. This will lead to program development related to statistical issues in coming years. Additionally, lead survey interviewer positions were created to add more structure to the team of interviewers and to share some of the supervisory responsibilities held by the survey coordinator. Finally, a working group was formed to oversee and influence the direction of the harvest surveys program. This working group consists of approximately 15 biologists, researchers, and other FWP personnel that make use of the harvest surveys estimates and represent various regions and divisions of the agency. The scope of the group is broad, but includes program directions as well as estimation methods.

This reorganization has resulted in several changes that affect estimates of hunting- and harvest- related quantities. As this is the first year these changes were implemented, survey methods are described with some detail in this report. Despite these changes, tables of estimates generated from the survey data look similar to those received by FWP staff in previous years. Those tables are presented in the results section.

Methods

Parameters estimated

In an effort to define the parameters of the LPT holder population that need to be estimated during the annual hunting and harvest survey, an effort was made to explicitly identify what quantities related to elk hunting and harvest are necessary for annual use by FWP staff and the public.

Hunting-related parameters

Hunter success. Based on recommendations of the working group, it was determined that this quantity is useful primarily at the statewide level for public interest. It is not usually necessary for hunting season regulation changes at the hunting district or regional levels. It is defined as the ratio of the number of LPT holders that harvested at least one elk during the hunting season to the number of LPT holders that actively participated in hunting. Estimates for both residents and nonresidents are required.

Number of hunters. This quantity is estimated at the hunting district, regional, and statewide levels. It is often useful for hunting season regulation changes, for example changes in total harvest may be due to fewer or more hunters rather than changes in elk population sizes. Further, it is required to estimate the economic impact of hunting in different areas, as these calculations rely on the number of hunters and hunter days. This quantity is defined as the number of LPT holders that spent at least a portion of one day hunting in the area of interest. Note that because each LPT holder can hunt in more than one hunting district, summing the total number of hunters in each hunting district will sum to more than the actual number of hunters in a given region or statewide. If a LPT holder hunts in more than one hunting district in a region, that LPT holder will count for only one hunter at the regional level. Estimates of hunters at the statewide level are based on asking LPT holders whether or not they hunted at all during the license year. Further, because LPT holders commonly possess and simultaneously hunt with more than one valid LPT at the same time in a given hunting district, it is not possible to make estimates of the number of hunters with a given LPT type. An LPT holder that hunts with more than one valid LPT at the same time is only one hunter; they are not counted as a one hunter for each LPT they possess at the time they are hunting. Because hunters cannot be both residents and nonresidents, however, it is possible to estimate the number of resident and non-resident hunters at the hunting district, regional, and statewide levels.

Hunter days. This quantity is also estimated at the hunting district, regional, and statewide level for the same reasons that the number of hunters is estimated at these levels. A hunter day is defined as an LPT holder spending at least a portion of a day hunting in a particular hunting district. Therefore, this quantity is defined as the number of days that LPT holders spent hunting in a particular hunting district, in hunting districts that fall within a given region, or in all hunting districts in the state. Note that it is possible and relatively common to hunt in more than one hunting district on one day, and FWP has traditionally questioned hunters about the number of days they spent hunting in each hunting district during the license year rather than each region or statewide. For this reason, estimates of the total number of hunter days in a region or statewide will be more than the number of days that LPT holders actually spent hunting in the region or in the state. This quantity might be more aptly termed hunter-district-days. Also, for the same reasons described above for estimates of the number of hunters, it is not possible to estimate the number of hunter days for each LPT that FWP issues. Estimates of hunter days are made for residents and nonresidents at the hunting district, regional, and statewide levels.

Days per hunter ratio. This quantity is estimated at the hunting district, regional, and statewide levels. It is used to monitor changes in hunter effort as an index of the density and distribution of elk with a given area. The quantity is defined as the ratio of the number of

days hunted to the number of hunters for a given area, and thus requires no additional questions beyond those already asked of LPT holders during the survey interview. Because the number of hunter days and the number of hunters are estimated for residents and nonresidents, estimates of the days per hunter ratio are also estimated for residents and nonresidents only (i.e. not for each LPT).

Harvest-related parameters

Total harvest. This quantity is fundamental to wildlife management decisions at the hunting district, regional, and statewide levels. It is defined as the total number of elk harvested by LPT holders during the license year.

Management success. This quantity is estimated at the hunting district, regional, and statewide levels. It is useful for making changes to quotas of special permits and second elk licenses at these levels. It is defined as the total elk harvest estimate divided by the total number issued of a given LPT.

Harvest by age-sex classes. This quantity is also fundamental to wildlife management in Montana. Estimates of the total number of bulls, cows, and calves are needed at the hunting district, regional, and statewide levels on an annual basis to determine if adjustments to hunting season regulations or quotas need to be made in order to meet management goals.

Harvest by land ownership status. This quantity is sometimes useful for evaluation of wildlife and land management programs at the hunting district, regional, and statewide levels. In particular, as public access to wildlife on private lands becomes more difficult to obtain, estimates of the total elk harvest on public, private, or Block Management Area lands can be useful to adjust the hunting season regulations in particular areas. These estimates can also be useful for evaluation of the contribution of the Block Management program to public elk harvest on private lands.

Harvest by method. This quantity is sometimes useful as issues related to total harvest by archery and rifle hunters arise. In these cases, the information may be useful at the hunting district, regional, or statewide levels in order to make changes to hunting season regulations, specifically method of take regulations.

Bull harvest by antler class. This quantity is sometimes useful for hunting regulation decisions at the hunting district, regional, and statewide levels. The public also uses it to plan hunting trips. Currently, this quantity is defined as the total number of bull elk harvested in each of nine classes, including yearling bull elk, and bulls with a maximum of two to nine antler points on one side.

Harvest by time period. This quantity is sometimes useful for creating hunting regulations to ensure desired distribution of harvest across time during the hunting season at the hunting district, regional, or statewide levels. The main use of the information currently is to evaluate the effectiveness of customized “season within season” type regulations. An example of this type of regulation is when a particular area is only open to hunting during a portion of the general season. This quantity is defined as the total elk harvest in each of seven time periods, including prior to the general rifle season, during each week of the five-week general rifle season, and after the general rifle season.

Sampling

Strata formation and sampling rates

Because harvest-related statistics are desired and can be estimated by residency for each LPT, residency and LPT were used to define sampling strata. Additionally, the FWP Automated Licensing System (ALS) stores all LPT and residency information as subcategories of a variable called Item Type, which indicates how certain opportunities were sold to the public. Because ALS is the source of the LPT holder population, and Item Type is difficult to remove from descriptions of opportunities for different combinations LPT and residency within the ALS system, Item Type was also included in the formation of sampling strata. Thus, sampling strata were defined as distinct combinations of residency, LPT type, and Item Type. This resulted in formation of 386 sampling strata.

Sampling rates for these strata were determined in large part using rationale and methods from previous years. Although rationale was not given in previous years for sampling rates of particular LPT's, the harvest survey team decided not to make large changes to the program prior to the hiring of a biometrician. However, the team did seek consultation from a Montana State University graduate student in Statistics to conduct the sampling. The contract statistician noted that in order to use the normal approximation to construct confidence intervals around point estimates of hunting and harvest statistics, the following assumptions are made:

- (1) $n\hat{p} \geq 10$
- (2) $n(1 - \hat{p}) \geq 10$
- (3) $20n \leq N$

Where n = sample size,

N = stratum population size, and

\hat{p} = the estimated proportion of LPT holders with a particular trait.

Based on these assumptions, as well as methods used in previous years, the following rules were used to determine sample sizes for each stratum:

- (1) For strata with up to 375 LPT holders, all LPT holders were sampled.
- (2) For strata with 1000 or more LPT holders, 55% of the LPT holders were sampled.
- (3) For strata of sizes between 375 and 1000 LPT holders, the percent of LPT holders sampled was determined based on a linear decrease between 100% and 55% of LPT holders sampled.

The accuracy and precision goals for these sampling rates were not articulated.

Sampling design

A random sample of size specified by sampling rate rules was drawn from each sampling stratum. However, owners of one LPT can also own other LPT's, meaning that the sampling frames for the various strata were not mutually exclusive. For example, every special permit holder also owns an elk general license as a prerequisite license. Survey protocol requires that interviewers ask LPT holders about all elk hunting and harvest activities regardless of which LPT they were sampled for. This implies that when a LPT holder was drawn into the sample for a particular LPT, they were also included in the sample for every other LPT that they owned. If each LPT owned by a LPT holder is considered part of a network that is defined by the ID number of a particular LPT holder, then this sampling procedure can be termed "stratified network sampling." Because of this sampling procedure, it is difficult to sample exactly at the pre-determined sampling rates. The size of the sample for each stratum depends on the LPT's owned by the LPT holders in that stratum and the sampling rates for those other strata. Thus, this procedure usually results in over-sampling of strata.

Data collection

A team of approximately 65 telephone interviewers that were supervised by the survey coordinator collected the hunting and harvest data. Interviewers were hired and trained during November and December of 2005. The majority of interviewers were hired in Bozeman, and a survey calling center was developed in the Bozeman FWP Regional office. Five lead interviewers were hired in Bozeman to structure the interviewing staff at the call center. Additionally, approximately a third of the interviewers were hired in other areas of the state to call resident LPT holders residing in their local calling areas.

Calls were made to the sample of elk LPT holders during January through March of 2006. Calls were made primarily from cell phones to avoid long-distance charges, though calls in local calling areas were made from landline phones to avoid cell phone minute charges. Sampled LPT holders were called up to three times in attempt to conduct the interview. If no contact was made at this point, uncontacted LPT holders were treated as non-respondents to the survey. When a contact was established with an LPT holder, interviewers asked license holders a set of pre-defined questions about elk hunting and harvest activities during the 2005 license year (Appendix 1). Answers to these questions were recorded on paper datasheets. During and following the calling period, lead interviewers and the survey coordinator edited completed datasheets in an effort to monitor the quality of data and to correct obvious mistakes.

After the data were collected from LPT holders, datasheets were bundled and delivered to a data entry contractor. The contractor entered the data into a centralized Oracle database using data entry forms developed by FWP programmer analysts using Oracle Forms.

Data quality control and management

Quality control

Once data were entered to the database, additional quality control was performed using SQL in the Oracle database. This included eliminating duplicate records and enforcing data integrity constraints (e.g. only allowing valid hunting districts, not allowing cows with branch

antlers, etc.). In many cases this involved the creation of unknown categories for analysis and estimation, for example an unknown age-sex class, unknown hunting districts with regions and statewide, and others. While these categories may not be of direct interest, these data are useful for estimating hunting and harvest parameters at higher levels, for example total harvest including the unknown age-sex class and regional and statewide hunting and harvest statistics in the case of unknown hunting districts.

Analysis table creation

Because hunting effort statistics can be estimated by residency status, while harvest statistics can be estimated by residency and LPT, two tables were needed for analyses. A table to estimate hunting effort statistics was created containing a record for every resident and non-resident license holder that responded to the elk survey. Each record captures information on whether a license holder hunted, the districts in which they hunted, the number of days they hunted in those districts, and whether or not they harvested an elk.

A table to estimate harvest statistics was created containing a record for every LPT owned by every license holder that responded to the elk survey. Each record includes information on the Item Type of the LPT, which hunter owned the LPT, the residency of that hunter, the total number of that type of LPT issued, whether an elk was harvested with that LPT, as well as details about elk that were harvested including the hunting district where the elk was harvested, the age-sex class, the number of antler points for harvested bulls, the time period when the animal was harvested, whether the animal was harvested with a bow or a rifle, and the ownership status of the land where the animal was harvested.

A major issue in the creation of the table for estimation of harvest statistics is that we did not consistently ask LPT holders which LPT was used to harvest elk when hunters were successful. Therefore assigning harvested elk to LPT's owned by a successful hunter required additional programming work. The basic algorithm used to assign harvested elk to particular LPT's relied on the regulations database. Considering the legal definitions for each LPT owned by responding LPT holders, such as allowable age-sex classes, allowable methods of take, etc., each reported elk that was harvested was assigned to an LPT owned by the LPT holder.

It was not uncommon for a harvested animal reported by a hunter to fit within the legal definitions of more than one LPT, for example some hunting districts allow hunters to harvest antlerless elk with a general license or an A-9/B-12 license. In many cases, it was possible to determine if an A-9/B-12 license was used to harvest an animal based on the different portions of the datasheet used to collect information on animals harvested with A-9/B-12 kills and kills made with other LPT's. However, it became apparent that not all interviewers used the different portions of the datasheet in the same manner, so it was not always possible to separate A-9/B-12 kills from kills made with other LPT's in this manner. Additionally, separating kills made with LPT's other than A-9/B-12 licenses was not possible using this method. When hunters harvested an animal that fit within the legal definitions of more than one LPT owned by the hunter and for which the LPT used could not be determined using separate portions of the data collection form, we assumed that hunters harvested elk with LPT's in order of most restrictive to least restrictive hunting opportunities. This implies that hunters made use of special permits or A-7 licenses before A-9/B-12 licenses, and that they used general licenses last. The primary reason for making this assumption is that if hunters own more than one license, using LPT's to harvest animals in this order allows hunters maximum flexibility in remaining hunting opportunities

following use of a particular LPT. Bias introduced into estimates of harvest by making this assumption would be an over-estimate of harvest with more restrictive LPT's and an underestimate of harvest with less restrictive LPT's.

Another uncertainty that arose during the process of assigning harvested elk to LPT's owned by successful hunters was the case that characteristics of harvested animals did not fit within the legal definitions of any LPT(s) owned by the hunter. The most common cases of this type of situation were harvesting an elk in a hunting district where general licenses were not valid when the hunter owned a general license, and harvesting an age-sex class that was not valid to harvest with a general license when the hunter owned a general license. In both of these situations, it appeared that hunters were harvesting animals that would have been valid to harvest in many if not most other hunting districts with a general license. In these cases, we therefore assumed that the hunter harvested the animal with a general license, based the logic that hunters likely used one of the LPT's that they owned to harvest the animal. In previous years, these types of kills were assigned to LPT's named "UnkKill" or "UnkDist." This practice was avoided because these LPT's were not sampled, making reliable estimates of harvest with these LPT's difficult. We also believe that this terminology is confusing.

Data analysis

Response rate

Non-response can bias estimates of hunting effort and harvest parameter estimates. The potential for bias increases with the amount of non-response, and therefore higher response rates protect against non-response bias. In an effort to be clear about the potential for non-response bias in estimates of hunting effort and harvest statistics, response rates were calculated. Because hunting effort statistics were calculated for residents and nonresidents only, while harvest-related statistics were calculated for each stratum, response rates were calculated at these levels as the number of respondents divided by the number of LPT holders sampled at each of these levels.

Sampling design issues

Analyzing the data collected from each stratum as though it were a simple random sample could lead to biased estimates due to the stratified network sampling design. For example, a substantial fraction of the resident general elk license holder population is composed of elk special permit holders, because the general license is a prerequisite license for special permits. As several of the elk special permit holder populations are less than 375 individuals, these populations are sampled at 100%. Thus, these special permit holder populations have a 100% chance of being included in the resident general elk license holder sample because of the stratified network sampling design. By contrast, residents that only have an elk general license have a <100% chance of being included in the sample of the resident general elk license population. If a relationship exists between the probability of an LPT holder harvesting an elk with a general license and whether or not that LPT holder also owns an elk special permit, the estimate of total harvest for the resident general elk license sample will be biased if analyzed as though it were a simple random sample. This bias will be proportional to the covariance between the harvest rate with special permits and the harvest rate with the elk general license for hunters that have both types of LPT's. Specifically,

$$bias(\hat{H}_{gen}) \approx \frac{Cov(\bar{H}_{perm}, \bar{H}_{gen})}{\bar{H}_{perm}} \quad (1)$$

where \hat{H}_{gen} = the estimated total harvest with the resident general elk license,
 \bar{H}_{perm} = the true harvest rate for resident elk special permits, and
 \bar{H}_{gen} = the true harvest rate for the resident general elk license (*sensu* Bethlehem 2002).

To protect against this source of bias, estimators for hunting effort and harvest must be adjusted to account for variable probabilities of inclusion into the sample for different sample networks. These inclusion probabilities can be defined as the probability that any LPT attached to a particular network was selected in any stratum:

$$\pi_k = 1 - \prod_{h=1}^L \frac{\binom{M_h - m_{hk}^*}{n_h}}{\binom{M_h}{n_h}} \quad (2)$$

where π_k = the inclusion probability for LPT's in the network owned by LPT holder k ,
 h = stratum number 1 to L ,
 M_h = the number of LPT's issued in stratum h ,
 m_{hk}^* = the number of LPT's attached to the k^{th} network in stratum h , and
 n_h = the sample size in stratum h (Thompson 2002).

Inclusion probabilities were only for responding LPT holders, and thus we implicitly assume that non-respondents were missing at random (MAR) from the sample (Lohr 1999). For this method to produce unbiased estimates, there must be little or no relationship between the probability that an LPT holder responded to the survey and the hunting effort and harvest statistics being estimated. For example, if non-respondents were less likely to harvest an elk than respondents, then estimates of elk total harvest will be biased high.

Inclusion probabilities were applied to each responding LPT holder in the case of hunting effort related statistics and to every LPT owned by an LPT holder in the case of harvest related statistics (Thompson 2002).

Estimation of hunting effort and harvest parameters

To estimate hunting effort statistics, a sampling weight was calculated for each responding LPT holder as:

$$w_k = \frac{1}{\pi_k} \quad (3)$$

where w_k = the sampling weight for the LPT holder that owns network k , and
 π_k = the inclusion probability for network k .

To use these weights to make estimates of population parameters, they should reflect the characteristics of the population of interests (Horvitz and Thompson 1952, Lohr 1999). In this case, this implies that the weights for responding resident LPT holders should sum to the total number of resident LPT holders and the weights for responding nonresident LPT holders should sum to the total number of nonresident LPT holders. Weights were therefore “grossed up” to the populations of resident and nonresident LPT holders using:

$$ws_k = w_k \frac{N_h}{\sum_{k=1}^{n_h} w_k} \quad (4)$$

where ws_k = the grossed up weight for the LPT holder that owns network k ,
 w_k = the sampling weight for the LPT holder that owns network k ,
 N_h = the total number of LPT holders in residency h , and
 n_h = the number of responding LPT holders in residency h (Raab et al. 2006).

Because of this weighting scheme, calculations to estimate hunting effort statistics implicitly assume that non-responding LPT holders are MAR within each residency. Using grossed up weights, hunter success was estimated at the statewide level as a weighted mean success rate for the subpopulation of LPT holders that reported hunting:

$$\hat{s}_h = \frac{\sum_{k=1}^{n_h^*} y_k ws_k}{\sum_{k=1}^{n_h^*} ws_k} \quad (5)$$

where \hat{s}_h = the estimated hunter success rate for residency h ,
 n_h^* = the number of responding LPT holders in residency h that reported hunting,
 y_k = a variable indicating whether LPT holder k harvested an elk, and
 ws_k = the grossed up weight for the LPT holder that owns network k .

The number of hunters was estimated at the statewide, regional, and hunting district levels using the Horvitz-Thompson estimator:

$$\hat{H}_h = \sum_{k=1}^{n_h} \frac{y_k}{\left(\frac{1}{ws_k} \right)} \quad (6)$$

where \hat{H}_h = the estimated number of hunters of residency h in the area of interest,
 n_h = the number of responding LPT holders in residency h ,
 y_k = a variable indicating whether LPT holder k hunted in the area of interest, and
 ws_k = the grossed up weight for the LPT holder that owns network k (Horvitz and Thompson 1952).

To estimate the number of hunter days and the days:hunter ratio at the statewide, regional, and hunting district levels, we first had to deal with the issue of item non-response for the number of days reported hunting. That is, 39 hunters reported hunting in hunting district in license year 2005, but they did not report the number of days that they hunted in that district. In order to use the full sample to estimate the number of hunter days and the days:hunter ratio, we decided to impute data for the number of days hunted by those 39 hunters that did not report the number of days that they hunted. In order to eliminate effects on the estimated total number of days hunted and the days:hunter ratio, we could set the value of the missing data equal to the mean for residents and nonresidents. This “cell mean imputation” would effectively not use the imputed data values in estimating the total number of days or the days:hunter ratio. However, this would lead to underestimation of our uncertainty in those estimates because these 39 hunters would be assigned days hunted values that did not deviate from the mean. In order to minimize effects on estimates of the total number of days hunted and the days:hunter ratio, as well as the associated estimates of uncertainty, we therefore use a “cell mean model” to impute these missing values (Lohr 1999). We assumed that these hunters had days hunted values that fell along a normal distribution with mean equal to the weighted mean for residents or nonresidents, and variance equal to the weighted variance for residents or nonresidents:

$$d_{hk}^* \sim N(\mu_h, \sigma_h^2) \quad (7)$$

where d_{hk}^* = the missing value for days hunted for the LPT of residency h that owns network k ,
 μ_h = the weighted mean number of days hunted for residency h , and
 σ_h^2 = the weighted variance of the mean number of days hunted for residency h .

Once these 39 values were imputed, the number of days hunted for residency h (\hat{D}_h) was estimated using the Horvitz-Thompson estimator in equation (6) above, with y_k set equal to the number of days hunted for LPT holder k in the hunting district of interest (or the number of days hunted in hunting districts falling within the region of interested or the total number of days hunted in hunting districts within the state at the higher levels). The days:hunter ratio for each area of interest was then estimated using a ratio estimator:

$$\hat{R}_h = \frac{\hat{D}_h}{\hat{H}_h} \quad (8)$$

where \hat{R}_h = the estimated days:hunter ratio in the area of interest for residency h ,

\hat{D}_h = the estimated number of hunter days in the area of interest for residency h ,
and

\hat{H}_h = the estimated number of hunters in the area of interest for residency h .

All variances for hunter effort statistics were estimated using Taylor Series linearization (Woodruff 1971) and corrected for large sampling fractions using a finite population correction (fpc) factor (Thompson 2002). Combined residency hunter effort statistics were estimated using equations for stratified sampling, treating residency as the stratifying variable (Thompson 2002). To estimate the combined residency days:hunter ratio in a particular area, estimates for residents and nonresidents were weighted by the estimated number of hunters in that area rather than the total number of resident and nonresident LPT holders. This was done in order to avoid down-weighting estimates of the ratio in the cases where only residents or nonresidents reported hunting in an area. Therefore, combined residency estimates of the days:hunter ratio are conditioned on the LPT holders that reported hunting in a particular area, and can be interpreted as the expected number of days that an LPT holder hunted in a particular area, given that they hunted in the area.

Confidence intervals around hunter effort statistics were calculated using the normal distribution approximation:

$$\hat{y} \pm z^* \sqrt{\text{var}(\hat{y})} \quad (9)$$

where \hat{y} = the point estimate for the population quantity of interest,

z^* = the 90th percentile value from the normal distribution (1.2816), and

$\text{var}(\hat{y})$ = the fpc-corrected sample variance of the point estimate for the population quantity of interest.

The absolute lower boundary of confidence intervals was set to the number of LPT holders in the sample with the population characteristic of interest, as this is the minimum number of LPT holders known to have the characteristic. Confidence intervals were not adjusted for multiple comparisons, and therefore cannot be interpreted as simultaneous confidence intervals. Thus we expect 20% of the intervals around point estimates not to contain the true population value.

To estimate elk harvest statistics, the sampling weight for each responding LPT holder was applied to every LPT owned by that LPT holder. These LPT sampling weights were then grossed up to sum to the number of LPT's issued within each combination of residency and LPT using formula (4) above. This weighting scheme assumes that LPT's owned by non-responding LPT holders were MAR within each combination of residency and LPT.

Elk harvest statistics were estimated as totals for hunting districts, regions, and the state by residency and LPT or residency and LPT types (i.e. special permits, A-7 licenses, and A-9/B-12 licenses). Total harvest, as well as harvest by age-sex classes, land ownership status, method, antler point class, and time period within each stratum in the area of interest were estimated with the Horvitz-Thompson estimator in equation (6) above. Estimates were generated for each sampling stratum, and then combined into estimates for residency and LPT, by LPT across residency, and/or by type of LPT using estimators for stratified sampling (Thompson 2002).

Following tradition from the previous decade, the only harvest statistic for which an 80% confidence interval was estimated was total harvest. The variance of total harvest estimates was

estimated using Taylor Series linearization (Woodruff 1971) and was fpc corrected (Thompson 2002). However, the responding sample size for some strata was only one individual. In these cases, the stratum contribution to the variance is taken to be the average of all the strata with a responding sample size of more than one individual. This adjustment results in a conservative estimate of the total variance (Lumley 2004). Estimates of population parameters and associated variances were not made for strata in which there were no respondents; all statistics for these strata were set equal to zero.

The 80% confidence interval on total harvest was estimated using the normal approximation in equation (9) above. The absolute lower boundary of the total harvest confidence intervals were set to the number of LPT holders that reported harvesting an elk in the area of interest, as we know that this is the minimum number of elk harvested in each area of interest.

All data analyses were conducted using the R statistical software program (R Development Core Team 2006). Also, extensive use was made of the survey analysis package written for R (Lumley 2004).

Results

Response rates were generated for each LPT that was issued for elk hunting privileges, as well as by residency (Table 1). Estimates of hunter success were generated only at the statewide level (Table 2). Following requests from the harvest survey working group, the remaining hunter effort statistics were included in the same table containing estimates of total harvest and harvest by age-sex classes (Table 3). Estimates of elk harvest by land ownership status and by method are also contained in the same table (Table 4), while estimates of elk bull harvest by antler point class and elk total harvest by time period are presented in separate tables (Table 5, Table 6).

Table 1. Response rates for elk hunting and harvest survey strata, license year 2005.

residency	LPT	number_issued	number_sampled	responses	response_rate
N	100-00	6	6	1	0.17

Discussion

The License year 2005 elk hunting and harvest estimates are marked by several changes in the harvest survey program. After conversations with administrators and the harvest survey working group, several more changes are forthcoming. Some of these changes will be aimed at streamlining the harvest survey program, which will involve changes in the quantities that are estimated. For example, while elk harvest by land ownership status may be useful information for some purposes, this quantity is not always useful for season setting on an annual basis. Further, there may be better and more focused forums than harvest surveys to obtain this information. In coming years, this quantity will likely be dropped from the harvest survey program. Also, our ability to obtain reliable estimates of bull harvest in nine bull antler classes and total elk harvest seven time periods at the hunting district level by sampling general LPT's is limited. The number of antler classes and time periods for which estimates are made will likely be reduced in coming years. Also, an objective in historical FWP elk management strategies was to ensure that harvest was evenly spread across the hunting season, but that element is absent from the most recent elk management plan. Therefore, discussions concerning the usefulness of this quantity for annual hunting season regulation setting processes will continue amongst members of the working group.

Another major forthcoming change is in regards to the assignment of harvested elk to specific LPT's owned by an LPT holder. The practice of not asking successful hunters which LPT was used to harvest elk is the most difficult and time consuming issue to deal with prior to data analyses. It also undoubtedly introduces bias that would be difficult to quantify and correct for. This practice will be discontinued in coming years in favor of asking LPT holders about harvest success and characteristics with specific LPT's that they owned. This may also eliminate the need to calculate inclusion probabilities for harvest-related statistics, because we will not necessarily have to ask LPT holders about elk harvested with all of the LPT's that they own. This will permit harvest estimation similar to that conducted during the previous decade, when inclusion probabilities were not accounted for. However, it is clear that variable inclusion probabilities existed for LPT holders during this time frame, so the potential bias described in equation (1) above is implicit in hunting and harvest estimates dating to at least 1995.

Also, because confidence intervals for harvest statistics are only estimated around total harvest, biologists that use the various harvest estimates for season setting cannot assess the reliability and precision of most estimated harvest parameters. This issue will be addressed in coming years. Accuracy and precision goals will be the focus of the sampling rate determination, and estimates that do not meet precision goals will be flagged in reports.

Despite the changes in staff and methods, presentation of hunting and harvest estimates is comparable to estimates from previous years. Many program changes may go unnoticed by end-users of the estimates from the hunting and harvest surveys. This will in fact be a goal of the program during the transition period, such that improvements to the program are more likely to gain acceptance by end-users.

Appendix 1: Elk hunting and harvest survey questionnaire.

2005 ELK

Our records show that you were issued a license or permit to hunt elk in Montana in 2005, which is shown on the address label below. Please record ALL of your OWN elk rifle and archery hunting activity in Montana, regardless of your license or permit type, during the past 2005 elk hunting season (Aug. 1, 2005 - Feb. 28, 2006). The information you provide will be used for management purposes. Thank you.

1. Did you HUNT ELK in Montana in the 2005 season?

¹NO ²YES

Hunting District Number	No. Days Hunted

IF YES, please complete the following:

2. List up to 3 hunting districts you hunted Elk, (regardless of license or permit type, whether you harvested an elk or not) and the total days in each, for all of your own elk rifle and archery hunting activity. Include district(s) in which you killed an elk.
(see map for 3 digit elk hunting district number)
3. Did you kill an Elk with your General, Special Permit, or A7 License? ¹NO ²YES
4. Did you purchase a 2nd Antlerless Elk License (A9/B12)? ¹NO ²YES
- 4a. If yes, did you kill an antlerless elk with your 2nd Antlerless Elk License (A9/B12)? ¹NO ²YES

Use this section for your General, Special Permit or A7 elk kill, but not for an antlerless A9/B12 elk kill.

5. In which hunting district did you kill your Elk? HUNTING DISTRICT	
6. Elk killed was a: <input type="radio"/> ¹ CALF <input type="radio"/> ² COW <input type="radio"/> ³ BULL	
6a. If a bull, how many points on each side? ANTLER POINTS (Side 1) (Side 2)	
7. Elk was killed during which time period? Before Oct 23 Nov 14 - 20 Nov 21 - Nov 27 After Nov 27	
<input type="radio"/> ² Oct 23-Oct 30 <input type="radio"/> ³ Oct 31-Nov 6 <input type="radio"/> ⁴ Nov 7 - 13 <input type="radio"/> ⁵ Nov 14 - 20 <input type="radio"/> ⁶ Nov 21 - Nov 27 <input type="radio"/> ⁷ After Nov 27 (First week) (Second week) (Third week) (Fourth week) (Fifth week)	
8. Did you make the kill with a bow? <input type="radio"/> ¹ NO <input type="radio"/> ² YES	
9. Was this kill on public or private land? <input type="radio"/> ¹ Public <input type="radio"/> ² Private, not BMA* <input type="radio"/> ³ Private, on BMA* <input type="radio"/> ⁴ Not sure	
*Block Management Area	

COMPLETE BELOW ONLY IF YOU KILLED AN ANTERLESS ELK WITH YOUR 2ND ANTERLESS ELK LICENSE (A9/B12)

10. In which hunting district did you kill this antlerless elk? HUNTING DISTRICT	
11. Elk killed was a: <input type="radio"/> ¹ CALF <input type="radio"/> ² COW	
12. Elk was killed during which time period? Before Oct 23 Nov 14 - 20 Nov 21 - Nov 27 After Nov 27	
<input type="radio"/> ² Oct 23-Oct 30 <input type="radio"/> ³ Oct 31 - 6 <input type="radio"/> ⁴ Nov 7 - 13 <input type="radio"/> ⁵ Nov 14 - 20 <input type="radio"/> ⁶ Nov 21 - Nov 27 <input type="radio"/> ⁷ After Nov 27 (First week) (Second week) (Third week) (Fourth week) (Fifth week)	
13. Did you make the kill with a bow? <input type="radio"/> ¹ NO <input type="radio"/> ² YES	
14. Was this kill on public or private land? <input type="radio"/> ¹ Public <input type="radio"/> ² Private, not BMA* <input type="radio"/> ³ Private, on BMA* <input type="radio"/> ⁴ Not sure	
*Block Management Area
